FIGURE 7.3 Two image pyramids and their statistics: (a) a Gaussian (approximation) pyramid and (b) a Laplacian (prediction residual) pyramid.

Wavelet vs. Pyramid vs. Subband Decomposition

- Wavelet transform is a particular way of generating the Laplacian pyramid
- There are many ways to interpret wavelet transform. Here we describe the generation of discrete wavelet transform using the treestructured subband decomposition (aka iterated filterbank) approach
 - 1D 2-band decomposition
 - 1D tree-structured subband decomposition
 - Harr wavelet as an example
 - Extension to 2D by separable processing

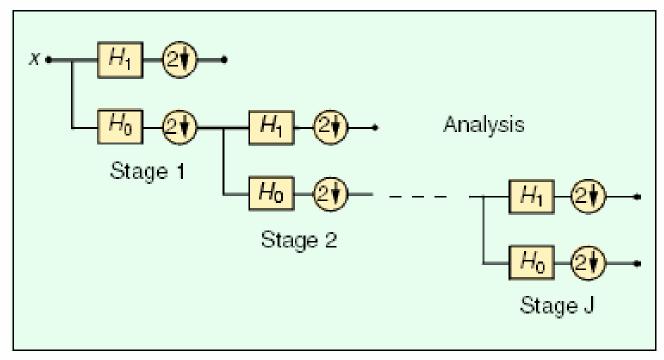

Example: Haar Filter

```
h0: averaging, [1,1]/\sqrt{2}; h1: difference, [1,-1]/\sqrt{2};
 g0 = [1,1]/\sqrt{2}; g1 = [-1,1]/\sqrt{2}
 Input sequence: [x1, x2, x3, x4,...]
 Analysis (Assuming samples outside the boundaries are 0. remember to flip the filter when doing convolution)
s = x * h0 = [s0, s1, s2, s3, s4,...], s0 = (x1+0)/\sqrt{2}, s1 = (x2+x1)/\sqrt{2}, s2 = (x3+x2)/\sqrt{2}, s3 = (x4+x3)/\sqrt{2}...
 v0 = s \downarrow 2 = [s1, s3,...,]
t = x * h1 = [t0, t1, t2, t3, t4, ...], t0 = [x1-0]/\sqrt{2}, t1 = [x2-x1]/\sqrt{2}, t2 = [x3-x2]/\sqrt{2}, t3 = [x4-x3]/\sqrt{2}, ...
 y1 = t \downarrow 2 = [t1, t3,...]
Synthesis:
u = v0 \uparrow 2 = [0, s1, 0, s3,...]
q = u * g0 = [q1, q2, q3, q4, ...], q1 = (s1+0)/\sqrt{2} = (x1+x2)/2, q2 = (0+s1)/\sqrt{2} = (x1+x2)/2, q3 = (s3+0)/\sqrt{2} = (x3+x4)/2
 v = y1 \uparrow 2 = [0, t1, 0, t3, ...]
r = v * g1 = [r1, r2, r3, r4, ...], r1 = (-t1 + 0)/\sqrt{2} = (x1 - x2)/2, r2 = (-0 + t1)/\sqrt{2} = (-x1 + x2)/2, r3 = (-t3 + 0)/\sqrt{2} = (x3 - x4)/2, r3 = (-t3 + 0)/2 = (x3 - x4)/2, r3 = (-t3 + 0)/2 = (x3 - x4)/2, r3 = (-t3 + 0)/2 = (x3 - x4)/2, r3 = (-t3 + 0)/2 = (x3 - x4)/2, r3 = (-t3 + 0)/2 = (x3 - x4)/2, r3 = (-t3 + 0)/2 = (x3 - x4)/2, r3 = (-t3 + 0)/2 = (x3 - x4)/2, r3 = (-t3 + 0)/2 = (x3 - x4)/2, r3 = (-t3 + 0)/2 = (x3 - x4)/2, r3 = (-t3 + 0)/2 = (x3 - x4)/2, r3 = (-t3 + 0)/2 = (x3 - x4)/2, r3 = (-t3 + 0)/2 = (x3 - x4)/2, r3 = (-t3 + 0)/2 = (x3 - x4)/2, r3 = (-t3 + 0)/2 = (x3 - x4)/2, r3 = (-t3 + 0)/2 = (x3 - x4)/2, r3 = (-t3 + 0)/2 = (x3 - x4)/2, r3 = (-t3 + 0)/2 = (x3 - x4)/2, r3 = (-t3 + 0)/2 = (x3 - x4)/2, r3 = (-t3 + 0)/2 = (x3 - x4)/2, r3 = (-t3 + 0)/2 = (x3 - x4)/2, r3 = (-t3 + 0)/2 = (x3 - x4)/2, r3 = (-t3 + 0)/2 = (x3 - x4)/2, r3 = (-t3 + 0)/2 = (x3 - x4)/2, r3 = (-t3 + 0)/2 = (x3 - x4)/2, r3 = (-t3 + 0)/2 = (x3 - x4)/2, r3 = (-t3 + 0)/2 = (x3 - x4)/2, r3 = (-t3 + 0)/2 = (x3 - x4)/2, r3 = (-t3 + 0)/2 = (x3 - x4)/2, r3 = (-t3 + 0)/2 = (x3 - x4)/2, r3 = (-t3 + 0)/2 = (x3 - x4)/2, r3 = (-t3 + 0)/2 = (x3 - x4)/2, r3 = (-t3 + 0)/2 = (x3 - x4)/2, r3 = (-t3 + 0)/2 = (x3 - x4)/2, r3 = (-t3 + 0)/2 = (x3 - x4)/2, r3 = (-t3 + 0)/2 = (x3 - x4)/2, r3 = (-t3 + 0)/2 = (x3 - x4)/2, r3 = (-t3 + 0)/2 = (x3 - x4)/2, r3 = (-t3 + 0)/2 = (x3 - x4)/2, r3 = (-t3 + 0)/2 = (x3 - x4)/2, r3 = (-t3 + 0)/2 = (x3 - x4)/2, r3 = (-t3 + 0)/2 = (x3 - x4)/2, r3 = (-t3 + 0)/2 = (x3 - x4)/2, r3 = (-t3 + 0)/2 = (x3 - x4)/2, r3 = (-t3 + 0)/2 = (x3 - x4)/2, r3 = (-t3 + 0)/2 = (x3 - x4)/2, r3 = (x3 - x
 \hat{x} = q + r = [q1 + r1, q2 + r2,...] = [x1, x2, x3,...]
```

Note with Haar wavelet, the lowpass subband essentially takes the average of every two samples, L=(x1+x2)/sqrt(2), and the highpass subband takes the difference of every two samples, H=(x1-x2)/sqrt(2).

For synthesis, you take the sum of the lowpass and high pass signal to recover first sample A=(L+H)/sqrt(2), and you take the difference to recover the second sample B=(L-H)/sqrt(2).

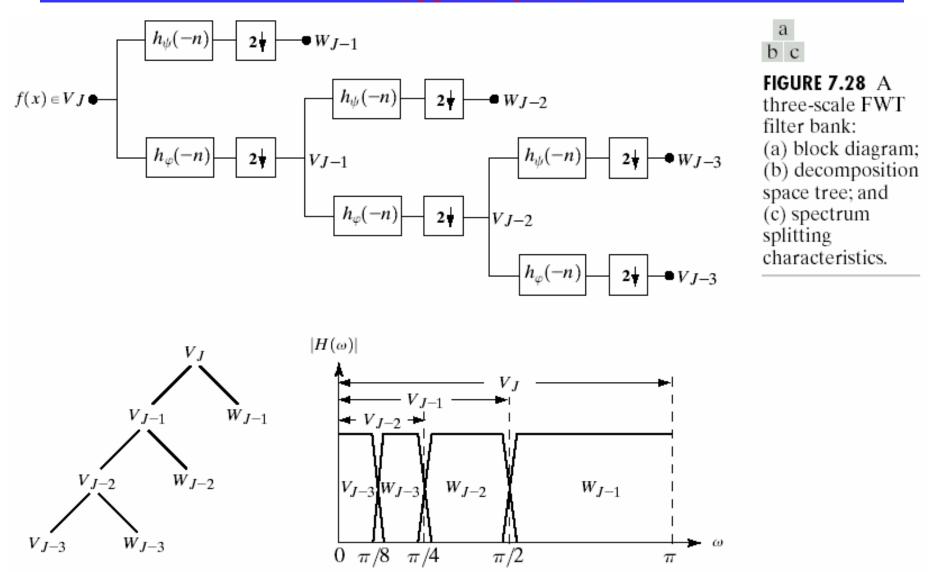

Iterated Filter Bank

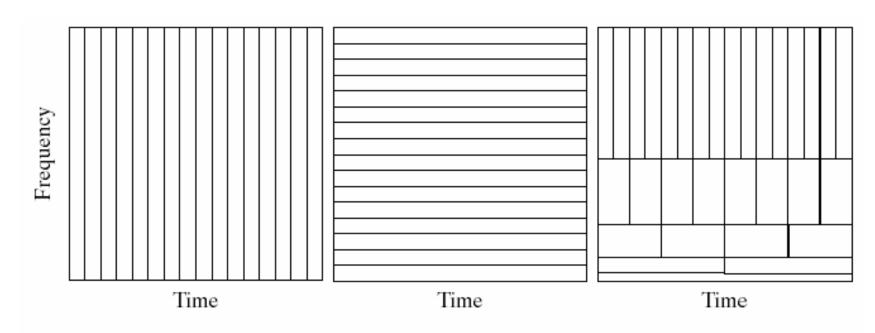

A 3. Iterated filter bank. The lowpass branch gets split repeatedly to get a discrete-time wavelet transform.

From [Vetterli01]

Discrete Wavelet Transform = Iterated Filter Bank

Temporal-Frequency Domain Partition

a b c

FIGURE 7.21 Time-frequency tilings for (a) sampled data, (b) FFT, and (c) FWT basis functions.

Wavelet Transform vs. Fourier Transform

- Fourier transform:
 - Basis functions cover the entire signal range, varying in frequency only
- Wavelet transform
 - Basis functions vary in frequency (called "scale") as well as spatial extend
 - High frequency basis covers a smaller area
 - Low frequency basis covers a larger area
 - Non-uniform partition of frequency range and spatial range
 - More appropriate for non-stationary signals

Haar Wavelet: Analysis

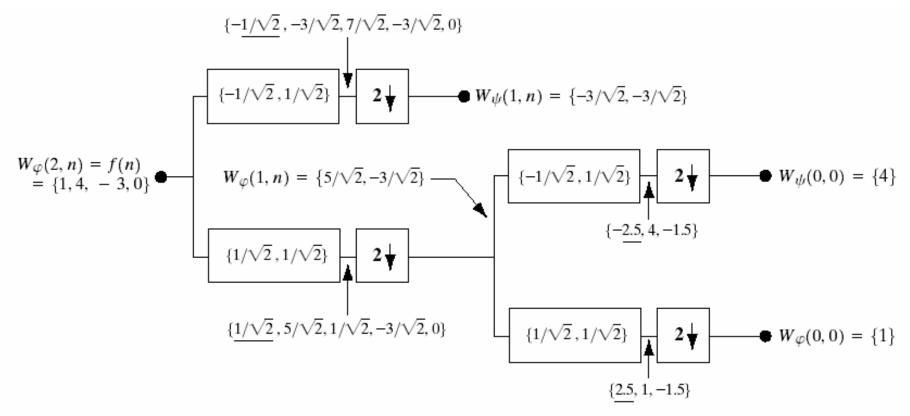

FIGURE 7.17 Computing a two-scale fast wavelet transform of sequence $\{1, 4, -3, 0\}$ using Haar scaling and wavelet vectors.

Note that the assumed high pass filter in this example has a factor "-1" difference from our previous example. Similarly the synthesis filter is off by the same factor. Both are OK.

Yao Wang, NYU-Poly EL5123: Wavelets & J2K 12

Haar Wavelet: Synthesis

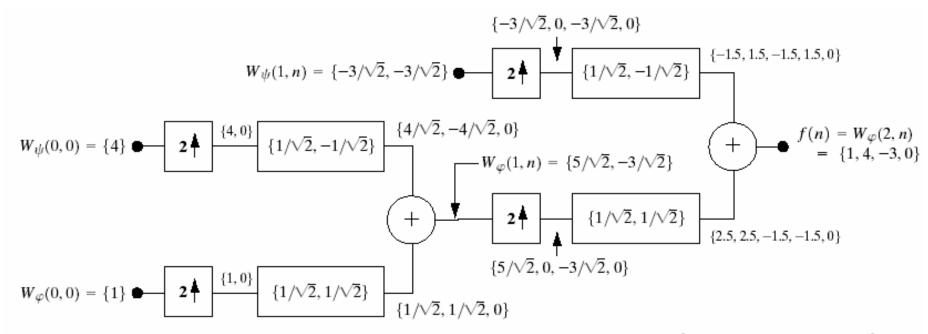

FIGURE 7.20 Computing a two-scale inverse fast wavelet transform of sequence $\{1, 4, -1.5\sqrt{2}, -1.5\sqrt{2}\}$ with Haar scaling and wavelet vectors.

How to Apply Filterbank to Images?

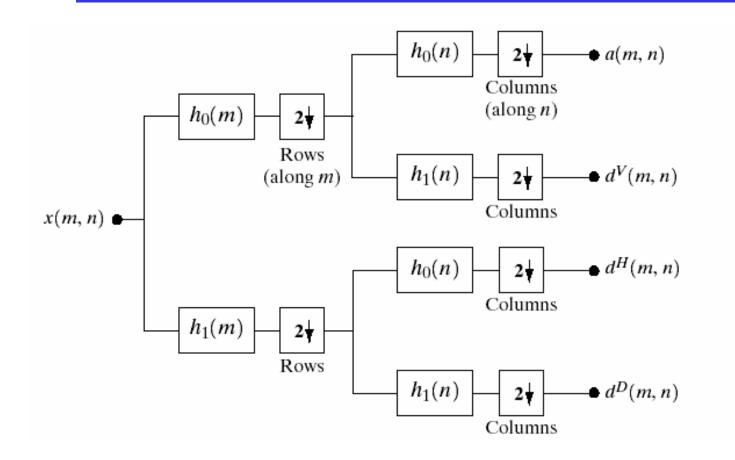

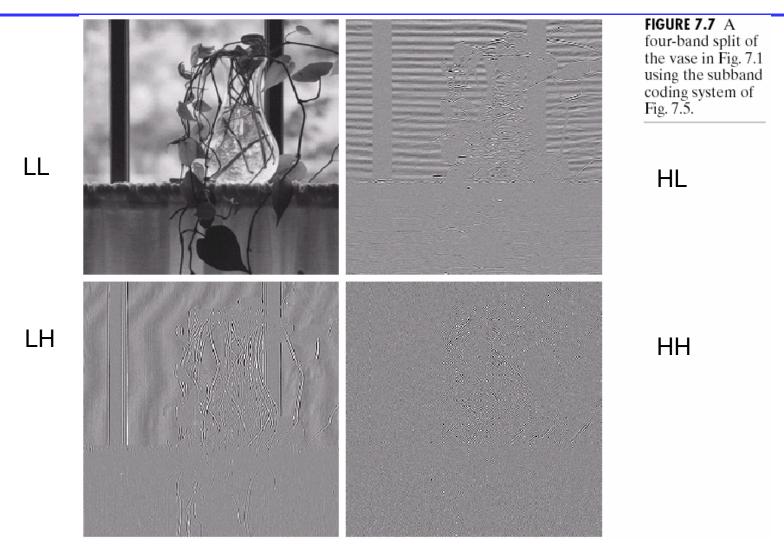

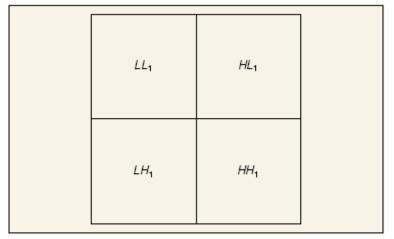

FIGURE 7.5 A two-dimensional, four-band filter bank for subband image coding.

2D decomposition is accomplished by applying the 1D decomposition along rows of an image first, and then columns.

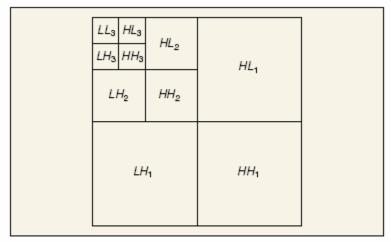

1 Stage Decomposition: 4 Subimages

Wavelet Transform for Images

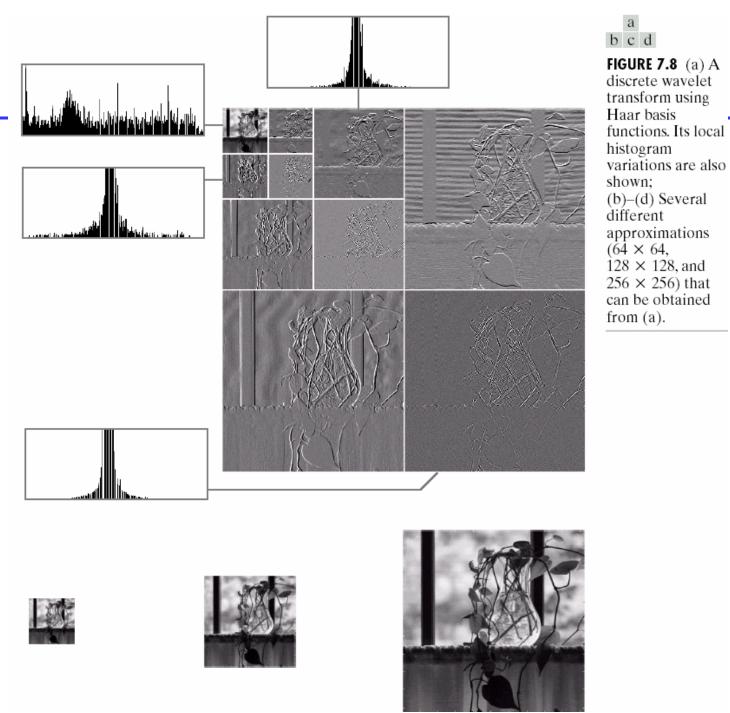

▲ 4. The subband labeling scheme for a one-level, 2-D wavelet transform.

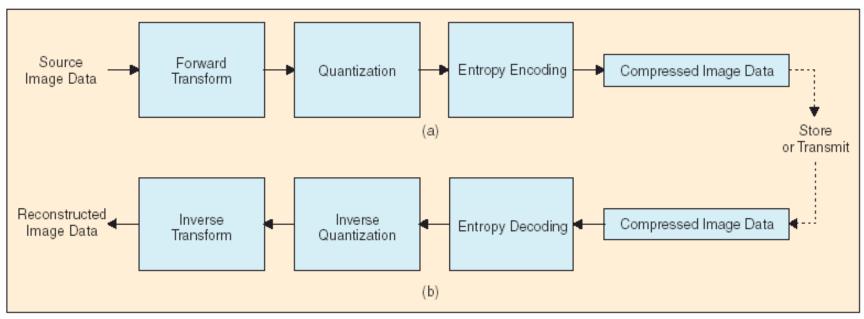

▲ 6. The subband labeling scheme for a three-level, 2-D wavelet transform.

From [Usevitch01]

JPEG2000 Codec Block Diagram

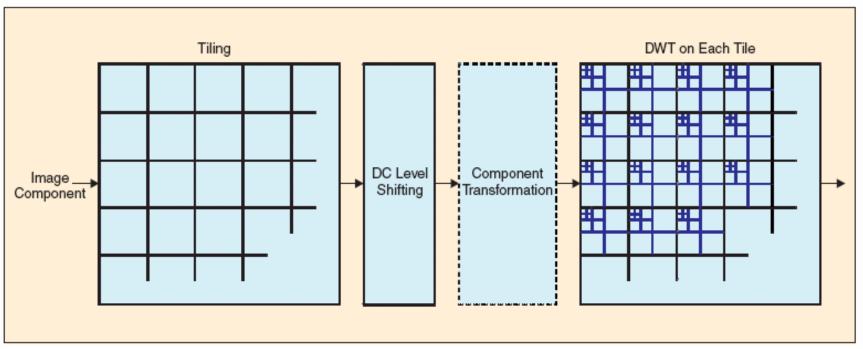

- ▲ 2. General block diagram of the JPEG 2000 (a) encoder and (b) decoder.
 - **Quantization**: Each subband may use a different step-size. Quantization can be skipped to achieve lossless coding
 - **Entropy coding**: Bit plane coding is used, the most significant bit plane is coded first.
 - Uses sophisticated context-based arithmetic coding
 - **Quality scalability** is achieved by decoding only partial bit planes, starting from the MSB. Skipping one bit plane while decoding = Increasing quantization stepsize by a factor of 2.

Lossless vs. Lossy

- Lossless
 - Use LeGall 5/3 filter
 - Use lifting implementation
 - Use an integer version of the RGB->YCbCr transformation
 - No quantization of coefficients

- Lossy
 - Use Daubechies9/7 filter
 - Use the conventional RGB->YCbCr transformation

Preprocessing Steps

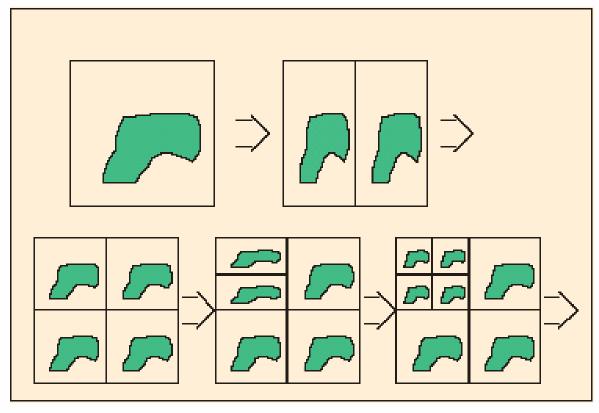

▲ 3. Tiling, dc-level shifting, color transformation (optional) and DWT of each image component.

- An image is divided into tiles, and each tile is processed independently
- Tiling can reduce the memory requirement and computation complexity
- Tiling also enable random access of different parts of an image
- The tile size controls trade-off between coding efficiency and complexity

Region of Interests

- Allows selected regions be coded with higher accuracy
 - Ex: faces

13. Wavelet domain ROI mask generation.
